Q: What is the difference between public and private access modifier in c#? I know that private access modifier is for class members and public access modifier is for the members of class. What does it mean when someone says public accessor or public modifier for c#? What does it do in our program? Is there any difference between the two access modifier? public string name = "e"; private string name = "e"; A: What it really means is that you can access it in other classes. Example: class MyClass { private string myMethod() { return "hello"; } public string myProperty { get { return myMethod(); } } } So now if you want to use MyClass.myProperty, you can access myMethod() and return "hello" A: The difference between the two is that with the private modifier the access is restricted to a class only. So you can not access public members from outside the class. But with the public accessor you can access all the private and public members of the class outside. A: When accessing a public property or method outside the class the compiler generates a proxy that calls into your class, possibly even some magic that hides the access modifier and turns it into public. The present invention relates to sawtooth waveform signal generators and more particularly to signal generators providing sawtooth waveforms of a variable frequency. Generally, a sawtooth waveform signal generator is an electronic circuit capable of generating a sawtooth waveform signal output in response to an input pulse signal. Sawtooth waveform signal generators may be comprised of a digital comparator circuit or a voltage controlled oscillator circuit. Digital comparator circuit sawtooth waveform signal generators are limited to a small frequency range (e.g., over approximately 2,500 Hz) and require that the signal being compared be a multiple of the frequency to be output by the signal generator. Voltage controlled oscillator (VCO) circuit sawtooth waveform signal generators generate the same frequency for all input voltages, but the level of the output signal can be controlled by the amplitude of the input signal. For example, a control circuit can provide a pulse

Diagnosis of pulmonary eosinophilia (Churg-Strauss syndrome) in an adult. A 48-year-old man was hospitalized with complaints of sore throat, shortness of breath, fever, and weight loss. Examination revealed hilar and mediastinal lymphadenopathy, clubbing, and periorbital edema. Chest roentgenograms showed an ill-defined right hilar mass. Computed tomography of the thorax revealed a mass and mediastinal lymphadenopathy. Computed tomography-guided needle biopsy revealed large numbers of eosinophils in the connective tissue stroma of a subcarinal lymph node. Eosinophils formed basket-shaped formations surrounding the tissue. The serosal lining of the lung was infiltrated by eosinophils, resulting in linear scarring. Blood eosinophilia was not detected, but a 24-hour urine collection showed an abnormal eosinophil count. Blood and urine cultures were negative. The patient was diagnosed as having pulmonary eosinophilia. The characteristic clinical and histologic findings in this patient are described and compared with those in other reported cases of pulmonary eosinophilia.

East African giraffe The East African giraffe (*Giraffa camelopardalis tippelskirchi*) is a subspecies of giraffe. In the wild, East African giraffe are sociable animals which stay in stable herds with the herd's dominant adult bull. Diet East African giraffe feed on large amounts of herbs, flowers, grasses, leaves, fruits, and bark, which is the only part of the plant which they can chew. The giraffe's tongue is divided into lobes,
