Best Prices and Best Service Guaranteed. . Microsoft Access. PDF help for Microsoft Access 2007:. No Help is available for this product.Q: Why does the performance increase in the program below when the variable value increases? Below is the java code, where variable vw, vh and s is of int data type. It is a simple loop, where in the inner loop the array s[][] is being accessed. My main question is that when the value of the variables vw and vh are 50 000 and 500, it takes around 5 seconds to run the program, however, when the value is increased to 1 million or 10 million it takes a very little time to execute the program. Why is that, when the data type of the variables vw and vh are same, they are just the size of the respective arrays (i.e. 100), shouldn't it still take same time to execute even if the values are increasing? Update As said above, when the size is increased the loop runs fast, how come when the size is 50 000, it takes long time? vw = new int[100][100]; vh = new int[100][100]; s = new int[100][100]; int i, j, k; for (i = 0; i < 100; i++) { for (j = 0; j < 100; j++) { s[i][j] = 0; } } for (i = 0; i < 100; i++) { for (j = 0; j < 100; j++) { vw[i][j] = 0; } } for (i = 0; i < 100; i++) { for (j = 0; j < 100; j
