QDó fui dado un llamado de una amiga mexicana, alerta 'lo que hacés es metete in la cama y deja de levantarte'. Baixa e descarrega: [Protv1].Q: Is there a way to use less nesting for a class to save on memory? I have a class containing a control, which contains a form etc, all of which inherit the control. I load an image in the constructor and store the size needed in the control. Every where I need the control I need to know the image size to get the next control to correctly size. Is there any way to make it possible to ask the control for the size, get it back, and make the other controls then resize, rather than repeat the same code over and over for each control? Edit: The control already contains all the information required to correctly calculate the sizes of each control, and it already contains a reference to the images needed for it to work. I just need a way to pull the size information without needing to allocate memory for each control and also get the controls to resize themselves. A: Have a look at the Control.Measure and Control.Arrange methods. Tera cotta: two tusked anteaters. Credit: Geneviève Arvier (Phys.org) —A highly toxic herbivore that has been extinct for tens of millions of years is a genetically distinct but closely related species, according to a new study published in the journal PLoS One. These results are important because they contradict previous claims that the species lay dormant for a long time and were "lost" among other species on a fresh volcanic island. Because of the exceptional characteristics of the three-toed giant anteater, it has long been suspected that it would have been isolated on an island. But previous genetic studies have concluded that it could not have survived in the absence of an immigration event. In a new study, an international team of scientists, led by Geneviève Arvier at the Institut de Recherche pour le Développement, has suggested an alternative explanation: that the species actually migrated to the island. They based this suggestion on the discovery of an extremely large number of mitochondrial DNA sequences in giant anteater blood samples. The presence of numerous mitochondrial sequences in a DNA sample implies
